

AMENDMENT TO THE CLAIMS

1. (currently amended) A method of food preparation including the steps of:
placing one or more food items on a carrier;
removeably positioning said carrier on a transport mechanism;
utilizing magnetic force to hold said carrier in a stable manner;
simultaneously rotating and advancing said carrier in a linear direction;
subjecting said food item(s) to a predetermined level of heat to cook the food items; and,
removing said carrier from said transport mechanism after said carrier has traveled a pre-determined distance.
2. (previously presented) The method of claim 1 wherein there are two items of food on said carrier during the preparation process.
3. (previously presented) The method of claim 2 wherein said carrier is a one piece member provided with a structurally weakened area.
4. (previously presented) The method of claim 3 wherein said food items are placed on said carrier so that said weakened area is positioned between said food items.
5. (previously presented) The method of claim 1 wherein there are three items of food on said carrier. ~~during the preparation process.~~
6. (previously presented) The method of claim 5 wherein said carrier is a one piece

member provided with a weakened area.

7. (previously presented) The method of claim 6 wherein said food items are placed on said carrier so that said weakened area is positioned between two of the three food items.

8. (previously presented) The method of claim 7 wherein there are four or more food items placed on said carrier.

9. (previously presented) The method of claim 1 wherein additional carriers are separately removeably positioned on said transport mechanism at pre-determined time intervals.

10. (previously presented) The method of claim 1 wherein a plurality of said carriers is placed in a pre-loading station.

11 (previously presented) The method of claim 1 wherein said carriers are stored at a pre-determined location. ~~after the heating process~~

12. (previously presented) The method of claim 1 wherein one end of said carrier is held on said transport mechanism and the other end is unsupported as it rotates and advances in said linear direction.

13. (canceled)

14. (canceled)

15. (withdrawn) A food preparation apparatus having
a top surface,
a bottom surface,
a guide rail positioned parallel to and between said top and bottom surface having a front
end and a back end,
heating means,
at least one removable food carrying means mounted on said guide rail for travel between
said front and back ends of said guide rail,
said food carrying means having a base that is mounted on said guide rail and an
unsupported end,
wherein food is placed between said base and said unsupported end and travels from said
front end to said back end of said guide rail such that it is cooked by said heating means.

16. (withdrawn) The apparatus of claim 15 wherein said food carrying means is held on
said guide rail by magnetic force.

17. (withdrawn) The apparatus of claim 15 wherein there are a plurality of said food
carrying means mounted on said guide rail at the same time.

18. (withdrawn) A food mounting skewer having a first end and a second end and at
least one weakened area located between said first end and said second end wherein there
is one portion of food on said skewer between said weakened area and said first end and a
second portion of food between said weakened area and said second end such that when

said skewer is broken at the weakened area there results a plurality of segments each having a portion of food for easy holding and eating of said food portions.

19. (withdrawn) The skewer of claim 18 where said skewer has two weakened areas and there is a portion of food spaced between said two weakened areas such that upon breaking said skewer at both weakened areas there results three independent segments each having a portion of food for easy holding and eating.

20. (withdrawn) The skewer of claim 18 wherein said first end is pointed so as to pierce food portions and wherein said second end is blunt so as to frictionally fit into a support base.

21. (previously presented) The method of claim 2 wherein said carrier is a two piece member in which said two pieces are releasably connected to each other.

22. (previously presented) The method of claim 1 wherein said carrier ~~can be~~ is initially positioned in one of a plurality of locations on said transport mechanism.

23. (previously presented) The method of claim 1 wherein there is a motor speed controller to vary ~~the~~ cooking time of said food items.

24. (withdrawn) The apparatus of claim 15 wherein a grease pan is provided to catch drippings.

25. (withdrawn) A transport system comprising

a guide rail,

a coiled drive means supported by said guide rail, and

carrier means located between adjacent coils of said drive means magnetically attached to said guide rail wherein rotation of said drive means causes said carrier means to advance in a linear direction.

26. (withdrawn) The transport system of claim 25 wherein said carrier means is a food carrying skewer.

27. (withdrawn) The transport system of claim 25 wherein said carrier means is two ended elongated member having one end magnetically attached to said guide rail and the other end remaining unsupported in space as it advances in said linear direction.

28, (currently amended) The method of claim 13 wherein said carrier is an elongated structure having two ends, said first end being attached to said transport mechanism and said second end being unsupported in space.

29. (currently Amended) The method of claim 13 wherein said transport mechanism includes a rotatable coiled drive means for advancing said carrier.

30. (withdrawn) The transport system of claim 25 wherein a plurality of magnets are provided on said guide rail.

31. (withdrawn) The transport system of claim 30 wherein said magnets are spaced on said guide rail in predetermined non-linear locations.
